

Part 2: Working with Figures

Lines

To draw a line use the Line tool in the toolbar.

Use the Shape inspector to change the line's dash pattern and color. Within the same inspector click the Line tab to see more options such as head and tail arrowheads.

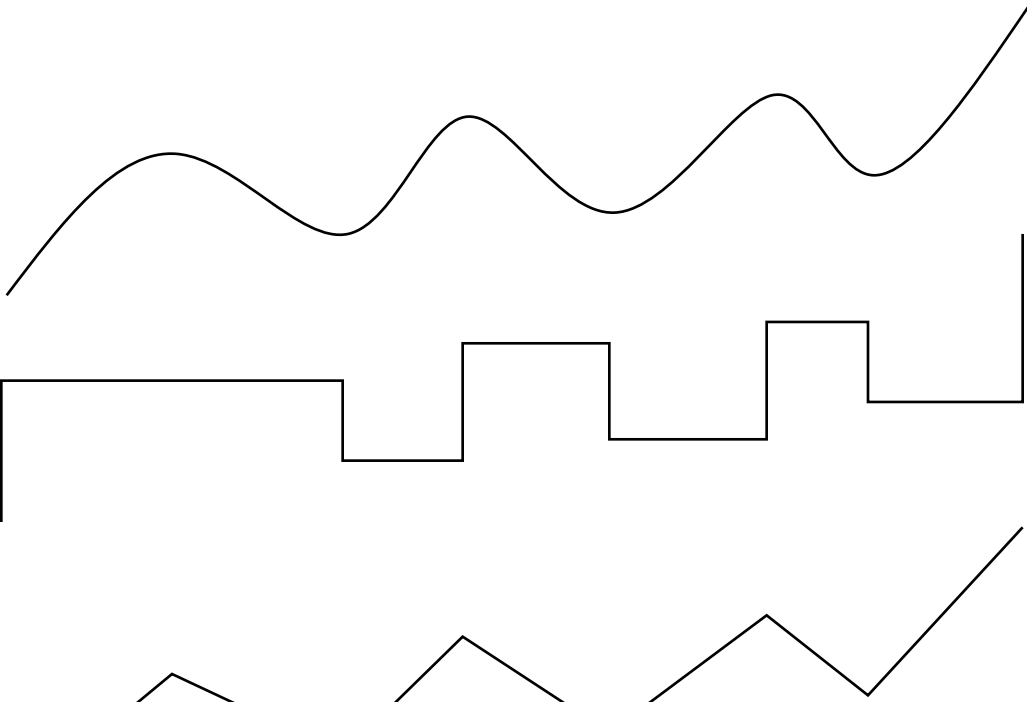

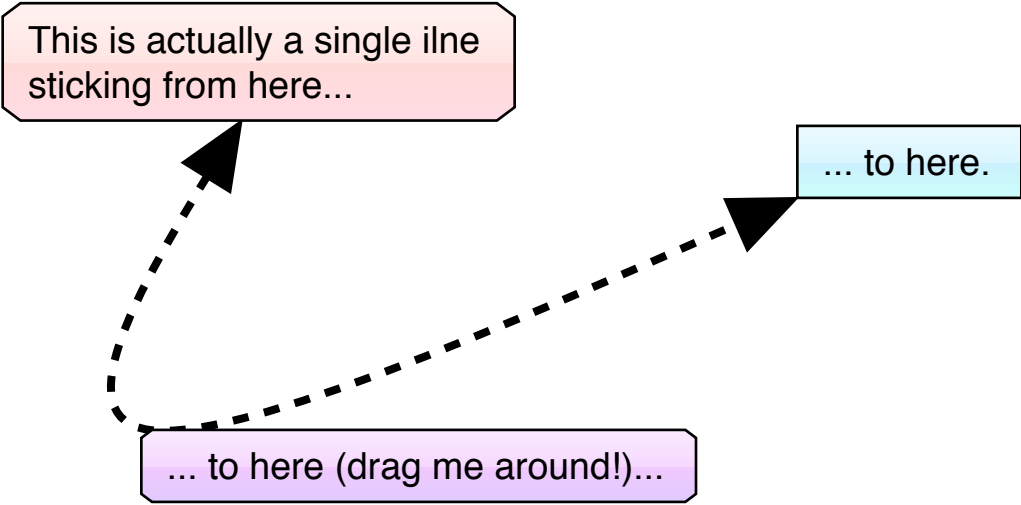

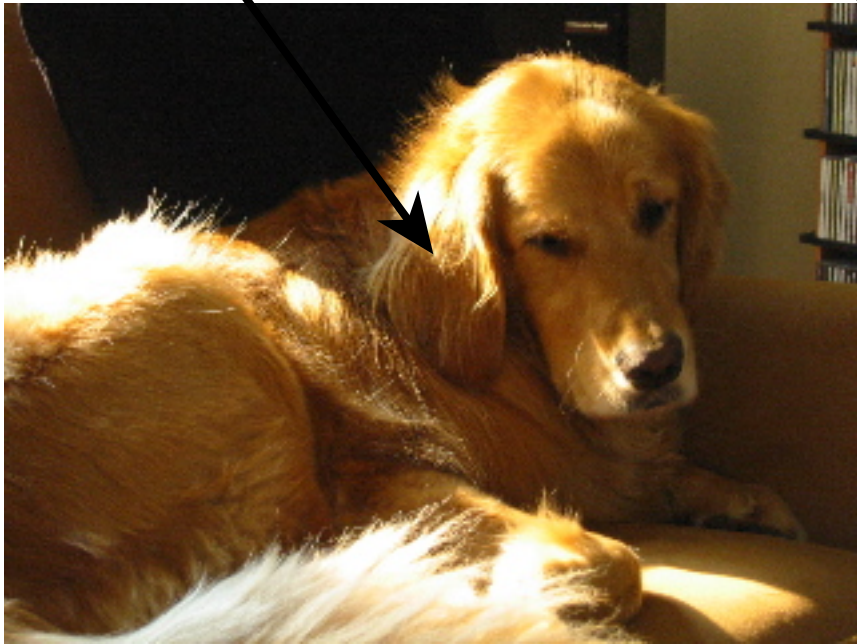

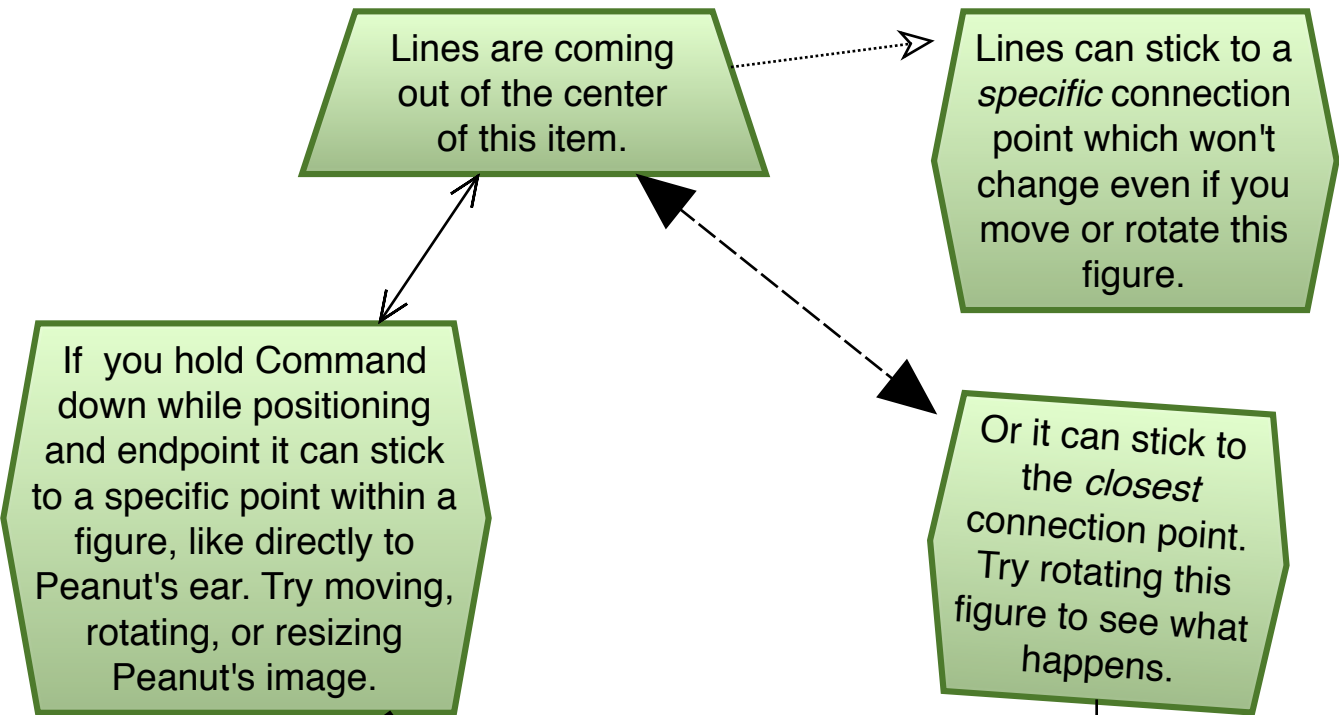

Sticky Lines

Normally lines in Curio are sticky so they connect towards the center of a figure, or to a specific connection point around the edge of a figure, or to the closest connection point, or to a specific point within the figure. You can enable or disable sticky lines via the Arrange > Sticky Lines menu item.

Curio also supports multipoint lines. Simply right click on a line and choose Insert Midpoint to add one or more midpoints. Each midpoint can stick to another figure as described above.

You can also draw a line and then hold down the Option key before releasing. You can then click to create as many midpoints as you want. Before your last click release the Option key and then click to create your last endpoint.

Right-click and choose Curved Line.

Or Orthogonal Line.

Or Straight Line.
